

Leena AI: EIR Score Breakdown

Bengaluru, India | Source: Foundit | Search: Entrepreneur in Residence AI Startup

Where It Lands

Leena AI scores 64, sitting in the orange Email Recruiter band, eleven points below the Apply Now threshold of 75. In the same search batch, Upgrad scored 91 and Thema scored 80, both crossing the green threshold. The gap is not a reflection of poor profile fit. It comes from four specific dimensions where the engine picked up signals in the JD and penalised accordingly. These four dimensions together account for most of the lost points, and they are explained in detail in the table below.

Dimension Breakdown

The engine scores 12 dimensions and weighs each differently. Of the twelve, eight dimensions scored well for this role. The four that pulled the score down are D1, D4, D7, and D9. These are flagged in red in the table and carry a combined weight of 40 percent, which is why their underperformance had a meaningful impact on the final number.

Dimension	Weight	Score	Reason
D1: Keyword Match	14%	65	The JD is short and does not use the specific tools and methods on the resume: JIRA, Notion, sprint planning, pre-sales, SQL, or UAT. The engine requires 40 unique keywords overlaps for a perfect score. A sparse JD like this one makes that threshold unreachable, which is a structural limitation rather than a profile mismatch.
D2: Semantic Match	15%	80	GTM, AI/ML, product thinking, and B2B SaaS all appear in the JD. Four of the five semantic categories fire cleanly. Strong score.
D3: Functional Overlap	13%	80	Product, Strategy, and Growth all map to the resume. Three of the four startup function buckets align well.
D4: Seniority Calibration	10%	40	The residency is designed to transition the hire into a Department Head or Director role within 12 to 18 months. The engine reads this exit outcome language as a seniority signal above the neutral mid-range and applies a penalty. For a profile with under two years of post-graduation experience, this calibration kicks in and costs meaningful points.
D5: Output Deliverables	10%	70	Analysis and database cleanup work feature in the JD but specs and presentation decks are not called out explicitly. Two of the three output types fire.
D6: Authority Verbs	9%	80	Own, build, drive, and execute appear consistently throughout JD. The engine rewards high-authority verb density.
D7: Archetype Fit	9%	40	Leena AI has raised over \$40M, serves 500 plus enterprise clients, and counts Bessemer Venture Partners and Greycroft among its backers. The engine classifies this as a late-stage company, not the Series A to C hypergrowth band where the archetype score reaches 80 percent. The JD reinforces this by framing Fortune 500 sales optimization as core work, which reads as a scaled company signal even if the internal pace is fast. This is the single biggest drag on the final score.
D8: Industry Adjacency	8%	100	Enterprise AI sits at the top of the industry tier. Maximum score.

Dimension	Weight	Score	Reason
D9: Founder Language	7%	35	The JD is written in a structured HR format with formal section headers, named role archetypes, and a defined 12-to-18-month career progression timeline. The engine scans for raw, direct founder-speak as a signal of a lean, direct-to-founder working environment and does not find enough of it here. Heavy bureaucracy signal, scored accordingly.
D10: Timing Score	6%	85	Fresh listing pulled via live API. Fixed at 85 for all current listings.
D11: Learning Curve	5%	95	Keyword overlap sits comfortably in the 20 to 80 percent sweet spot. The role offers real scope for growth without being a reach. Perfect score.
D12: Geo-Mobility	4%	100	Bengaluru is India. Full score.
