

Scoring Criteria:

What was included

Criterion	Why Included
Role Fit	The job title is the strongest single signal for whether a role is worth pursuing. Getting these wrong wastes time on everything downstream, so it carries the highest weight.
Skill Overlap	A role can have the right title but ask for skills that do not exist on the resume. This criterion catches that mismatch early and penalises JDs that require tools or qualifications outside the profile.
Industry Alignment	Domain context matters for day one credibility and long-term trajectory. Roles in AI, SaaS, VC, and consulting translate directly from prior experience and signal a shorter ramp-up.
Growth Signal	Early stage and hypergrowth environments are where the target roles, Chief of Staff, EIR, Founder's Office, actually exist and have real scope. Large company equivalents tend to be narrower and more siloed.
Seniority Match	Avoids wasting applications on roles that are structurally too senior or too junior. Carries the lowest weight because a human filter can catch edge cases faster than a keyword scan.
Location	Open to relocating anywhere in India. Included to ensure strong roles outside Gurugram are not filtered out before they are even seen.

What Was Excluded

Excluded Factor	Why
Salary	Unreliably published in Indian job listings. Penalising startups that do not list compensation would remove some of the most relevant opportunities from the results.
Company Brand	Not a proxy for role quality. A 20-person startup nobody has heard of can offer a far better operator opportunity than a recognised brand with a narrow role.
Network Proximity	Whether a connection exists at the company has no bearing on role quality. Good opportunities should not be filtered out simply because there is no existing relationship at the firm.
Company Health Signal	Financial health indicators such as funding recency or headcount trends were left out. A company in a lean phase may still offer the right role and the right environment to grow.
Compensation Fit	Comp data in Indian listings is too inconsistently published to score reliably. Using it would penalise strong roles at startups that choose not to disclose salary upfront.
